

Subqueries, Windows Function, CTE, Views and Stored Procedure

Database Link : [Maven Movies Data](#)

Assignment Guidelines :

- Use the **Maven Movies** database provided during the session.
 - Read each question carefully before writing the query.
 - Write SQL queries using proper formatting and indentation.
 - Use meaningful aliases for tables and columns wherever appropriate.
 - Use CTEs and Window Functions wherever they simplify the solution instead of writing unnecessarily complex nested queries.
 - Your submission should include:
 - SQL script (.sql)
-

Question 1

Display the names of customers who have rented more movies than the average number of rentals made by all customers.

Question 2

Display each film along with its rental rate and assign a rank based on rental rate from highest to lowest.

Question 3

Create a view that displays customer names along with their email and active status.

Question 4

Find the top 10 customers who generated the highest payment amount.

Question 5

Identify the customers whose total spending on rentals falls within the top 20% of all customers.

Question 6

Display every actor along with the number of movies they acted in and assign Dense Rank based on movie count.

Question 7

Create a view showing movie title, category, rental rate and replacement cost.

Question 8

Create a stored procedure that returns the top 20 most rented movies.

Question 9

Create a procedure that accepts a movie rating and returns all movies of that rating.

Question 10

Identify the top 3 films in each category based on their rental counts.

Question 11

Calculate the running total of rentals per category, ordered by rental count.

Question 12

Create a CTE to generate a report showing pairs of actors who have appeared in the same film together, using the film_actor table

Question 13

Create a procedure that accepts a customer ID as input and returns the customer's total payment as an output parameter.
